## Mountainside Family Healthcare Clinic Note - Final

**Charted Date/Time:** 10/10/2016 12:10

**CHIEF COMPLAINT: Came for followup and removal of suture.**
**HISTORY OF THE PRESENT ILLNESS: A 32-year-old who had an open fracture of the left hand and fixed it. The only complaint he has is about the pain, but he does not have any fever. He appears to be healing well. He is a very active person. He is going fishing for about 20 days. He has been advised many times not to do so because of the type of surgery he had, but he says that the only thing he need is pain medicine.??? At this moment, he finished his trial of antibiotic.He doesn't appears to be in acute pain and he he is planning to go fishing today until the 20 or 26 of Oct. ???**
**PAST SURGICAL HISTORY: Internal fixation of bones a couple of weeks ago in Juneau.**
**PAST MEDICAL HISTORY: Noncontributory.**
**SOCIAL HISTORY: Denies taking any drugs. He does not drink, he does not smoke.**
**PHYSICAL EXAM**
**Vitals: Blood pressure of 122/72, temperature 98.8, pulse 64, respiratory rate 16, height 70 inches, weight 169 pounds, oxygen saturation 98%.**
**General appearance: Revealed a male patient.**
**HEENT: Head: Normocephalic. Eyes: No sign of jaundice. Ears, nose, and throat: Within normal limit.**
**Neck: Supple.**
**Chest: Clear.**
**Heart: No murmur.**
**Upper Extremity: There is a dressing of the left hand. There is no sign of infection.Wound clean with 5 sutures.**
**Lower Extremity: Normal.**
**ASSESSMENT: Over the left finger of the metacarpophalangeal joint, he had a metal fix in, which is supposed to be out in November.**
**PLAN: The patient had sutures removed today. The wound appears to be very clean,no swelling and no redness. . There is no fever, but he insists to get more pain medication. I tried to explain to him that I will be willing to give him the 30 tablets of the Percocet 5/325, especially because he is working in his boat and fishing, and I am afraid that he may have more complication under the effect of the medicine. If he seems really sick, he should stay home, but he is saying at this time, he is going to get his father to go with him in the boat to work. Unfortunately, I have not been able to talk to anybody in his family, so they are aware of the dangerous situation of this gentleman when in the boat with an open fracture of the left hand. It has been lucky the there is no further complication at this moment, but I think the most likely needed for the pain is 3 tablets a day of the Percocet 5/325. He states that he does not know when he is coming back from the boat trip(20 of Oct.20 ?) but he may be around Juneau the 21st of Oct. I told him one more time that he could try to go to see the doctor that did the surgery in Juneau, but he states he does not think he needs to see him.????. He does want to bother him and he'll see him next month.Today sutures were removed.skin is very clean,no sign of infection.. So, I offered him an appointment for the 20th day, but apparently, he refused to come since he is not happy with the number of pain medication that he is getting.**

## Mountainside Family Healthcare Clinic Note - Final

**Charted Date/Time:** 10/03/2016 10:30

CHIEF COMPLAINT: Here for evaluation of open fracture of the left hand, the 17th of September.

HISTORY OF THE PRESENT ILLNESS: A 32-year-old male, fisherman, who had an open fracture of the left 3rd finger on the 17th of September. He was evaluated in the clinic that same day by Dr. Bakkes, and then, 3 days later by Dr. Roesel. X-ray was done and it was found that there was a fracture. Because of the complex fracture, he was sent to Juneau Orthopedics Service. He had a surgery on the 24th of September 2016 with the external fixation of the fracture of the left 3rd finger.

PAST MEDICAL HISTORY: Being healthy, very active.

PAST SURGICAL HISTORY: As I mentioned before, open fracture of the left hand.

CURRENT MEDICATIONS: The medications that he is taking at this moment include the Percocet 5/325 taken up to 8 a day; apparently, he had a prescription for 35 when he left Juneau, but they did not explain to him how to take it.

ALLERGIES: No allergies.

FAMILY HISTORY: Noncontributory.

PHYSICAL EXAM

Vitals: Blood pressure of 123/65, the pulse 57, the temperature 98.1, the respiratory rate 20, the weight 171 pounds, oxygen saturation 98%.
General appearance: Revealed a male patient.
HEENT: Head: Normocephalic. Eyes: No jaundice.
Neck: Within normal limits.
Chest: Lungs within normal limits.
Heart: Within normal limits.
Abdomen: Deferred.
Genitalia: Deferred.
Extremities: He has a dressing on the left hand over the left 3rd finger. He appears to be clean. No sign of inflammation. No redness.
Neurological examination: Neurological examinations were normal.

ASSESSMENT: Open fracture of the left finger in the metacarpophalangeal joint.

PLAN: The patient has been evaluated today. He had a new dressing. I spent about 25 minutes explaining to him about the importance of keeping the hand clean and staying away from work. He is well aware that going back to work like this is dangerous because he may have an accident again if the fracture were not healed properly. Because of the prevention of infection, he is planning to go back to his boat by the week of the 14th of October. I had given him antibiotics for 3 more days of the Augmentin

**875 twice a day. I showed to him that the medication be taken of the Percocet 5/325 one tablet 3 times a day at the most (total of 24 tab.,) , specially if he is going to be driving and working in the boat. I planned very clearly those concerns that I have, I took my time because the other important information that he need is to go back to his orthopedist next week, which is going to be by the 14th of October. So, I was going to make an appointment with Dr. Roesel, but he states that on that day that we learned that he was planning to go back and fish, so I do not know if he really understand the importance of taking care of his hand, but I make it so many times clear that it is a very dangerous situation for that, since he may had an infection on this place of the fracture.Return to clinic 10/10/16.**

## Mountainside Family Healthcare Clinic Note - Final

**Charted Date/Time:** 09/19/2016 09:54

CHIEF COMPLAINT: Follow-up left 3rd finger injury

HISTORY OF PRESENT ILLNESS: Casey is a 32-year-old male seen on Saturday urgent care clinic after he injured his left 3rd finger on a fishing boat. He was pulling the anchor and something snapped and struck his left 3rd knuckle and proximal interphalangeal joint. He had the laceration sutured at the time and was placed with a aluminum splint over the finger. He's been taking some Percocet for pain control and doing okay that way. He still has a lot of pain and swelling around the left 3rd finger.

PAST MEDICAL HISTORY: No chronic medical problems

MEDICATIONS: Percocet as needed for pain

ALLERGIES: No known drug allergies

SOCIAL HISTORY: Partial fisherman, nonsmoker

OBJECTIVE: Temperature 98.1, blood pressure 126/86, pulse 79 bpm, height 70-1/4 inches, weight 167 pounds, oxygen saturations 98 percent
The wound is not draining much, no purulent discharge and the wound edges are clean and approximated with sutures. He still has tenderness and weakness with flexion and extension against resistance and very little movement without resistance. Sensation is grossly intact. There is some ecchymoses around the base of his 3rd finger at the metacarpophalangeal joint.
3 view x-ray of the left 3rd finger reveals a fracture of the proximal phalanx through the proximal into the articular surface with comminuted fracture area.

ASSESSMENT: Open fracture left 3rd finger with extension into the articular surface of the metacarpophalangeal joint at the base of the proximal phalanx

PLAN: Start Augmentin 875 twice daily. His hand was immobilized with 2 inch fiberglass casting material that included all 4 of his fingers and the distal forearm. The wound have been cleaned and redressed prior to this. Referral to Juneau bone and joint for possible surgical intervention/orthopedic evaluation. Continue Percocet as needed for pain, rest, ice and elevate his extremity. Follow-up as needed.

## Mountainside Family Healthcare Clinic Note - Final

**Charted Date/Time:** 09/17/2016 16:46

CHIEF COMPLAINT: laceration back of L hand

HISTORY OF PRESENT ILLNESS: 32 yo M patient was 5 hours out of town about 7 hours ago working on his commercial fishing boat alone when his anchor chain broke while he was winching up the anchor and the chain snapped through the air and hit him back of L hand. Very painful and cut skin and bleeding. He states that he was initially able to fully extend the finger and also fully flex it, but very quickly became swollen and increasingly painful and he is no longer able to go all the way straight or all the way bent. Last tetanus shot was 2005.

PAST MEDICAL HISTORY: No chronic medical problems

MEDICATIONS: No medications

ALLERGIES: None

SOCIAL HISTORY: Nonsmoker. Commercial fisherman.

FAMILY HISTORY: Noncontributory

OBJECTIVE: Temp is 99.4. Blood pressure 130/84. Heart rate 78. Respirations 16. Weight 171 pounds. O2 sat 97% on room air. He is alert oriented and in no distress other than his left hand. 3 x 2 cm laceration over the dorsal surface of the PIP joint of his left hand third digit. Ecchymosis and edema over the left hand third metacarpal dorsal surface with 3 small (3-4 mm) skin lacerations.

He was able to flex and extend the left hand third metacarpal PIP joint passively and against small amount of resistance. He was not able to go fully through range of motion of the joint.

Third metacarpal was palpated distal to edematous area and was nontender. Sensation and cap RF intact.

The area of large laceration of PIP joint was infused with 5 cc 1% lidocaine and the wound was visually inspected. A very small portion of the extensor tendon was visualized and appeared intact and appeared to contract with extension. The soft tissues were significantly swollen and plan easily with exploration, which made visualization difficult. He was irrigated with sterile saline. He was scrubbed with chlorhexidine.

Simple interrupted repair with 4-0 proline. Patient tolerated well.

ASSESSMENT/PLAN: This injury was related to his job as a commercial fisherman. It would be appropriate for him to apply for fisherman's fund for this injury. Due for tetanus shot and this was given today. Blunt trauma to L hand dorsal surface third digit PIP joint and metacarpal with no apparent fx and apparently intact tendon. Would was irrigated and simple surficial repair. Discussed aftercare. Prescription was written for Percocet 5/325 #30 to use as needed for pain. Follow-up on Monday with Dr. Roesel for recheck.

XR Finger Left

IMPRESSION: Acute intra-articular fracture involving the base of long finger proximal phalanx. Significant soft tissue swelling involving the hand and long finger with suspected soft tissue foreign bodies dorsal to the long finger PIP.

INDICATION:
Gender/age: 32 years, Male
Order indication: :
History per patient: TRAUMA, INJURY LEFT 3RD FINGER

TECHNIQUE: A minimum of 2 views of the left finger were obtained.

COMPARISON: None

FINDINGS:
Significant soft tissue swelling involving the hand dorsum. Additionally, there is focal soft tissue swelling involving the dorsal aspect of the long finger at the proximal interphalangeal joint.

Acute, comminuted intra-articular fracture corresponding to the long finger proximal phalanx. Significant involvement and comminution of the proximal phalangeal articular surface. There are punctate foci of radiodensity corresponding to these soft tissue swelling at the long finger PIP. Question foreign body.
